AAS21244-AAS21518 encode for novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bioactive molecules to calls axpressing PRO polypeptides, and modulate biological activities of cells expressing PRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO polypeptide expression in a call sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation or differentiation of chondrocytes, the proliferation or cartilage, the proliferation of inner ear utricular supporting cells or of T-lymphocytes, the release of a cytokine from peripheral blood
                               Human secretory and transmembrane; PRO; mammalian; cancer; lung; breast; prostate; cervical; tumour necrosis factor-alpha; TNF-alpha; cartilage; ear; proliferation; glucose; free fatty acid; skeletal muscle; adipocyte; A-peptide; factor VIIA; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bloactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumours e.g. lung, breast, prostate, cervical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S;

 monocytes (PBMCs), or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adlocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polynuclocides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy.

This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human mamunoglobulin FC portion (e.g. AAX04302) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 86 novel genes and their fragments (nucleic acid sequences: AAX04311-x04410; amino acid sequences AAW78126-W78225) which are useful for preventing, treating or amaliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polymoclecides. Specific uses are described for each of the 86 polymoclecides. Specific uses are described for each of the 86 polymoclecides.

gene. The T243 gene encodes for a trinucleotide repeat protein (TRP). The invention describes methods of producing embryonic stem (ES) cells comprising a heterozygous disruption in a target DNA sequence (preferably gene T243) encoding a TRP and of producing a Rnockout mouse comprising a homozygous disruption in a gene encoding TRP, where the disruption inhibits the production of the wild type TRP. The invention also relates to identifying agents capable of affecting a phenotype of a knockout mouse. Also described are methods of determining whether expansion of the trinucleotide repeat in a gene encoding TRP produces a phenotypic change. The transgenic animals and the cells are useful for identifying compounds capable of ameliorating disease symptoms, and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel transgenic animals useful as animal model for characterization of function of a gene encoding trinucleotide repeat proteins (TRPs), contains heterozygous disruption in a gene encoding TRP -
                                                                                                                                                                                                                   The present sequence represents the DNA sequence of an expanded T243

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence encodes for murine trinucleotide repeat protein

(TRP). The invention describes methods of producing embryonic stem (ES)

cells comprising a heterozygous disruption in a target DNA sequence

(preferably gene T44) encoding a TRP and of producing a knockout mouse

comprising a homozygous disruption in a gene encoding TRP. Where the

disruption inhibits the production of the wild type TRP. The invention

also relates to identifying agents capable of affecting a phenotype of

a knockout mouse. Also described are methods of determining whether

ca knockout mouse. Also described are methods of determining whether

ca knockout mouse. The transgenic animals and the cells are useful for

chentifying compounds capable of ameliorating disease symptoms, and as

cherapies and interventions which may be effective in treating.

cherapies and interventions which may be effective in treating of disease. The animal models for trinucleotide repeat disorders e.g. fragile X syndrome and Huntington's

chincelotide repeat disorders e.g. fragile X syndrome and Huntington's

chincelotide repeat disorders e.g. fragile X syndrome and Huntington's

disease. The animal models for trinucleotide repeat disorders are ideal

model systems to study the progression of disease in vivo, the molecular

basis of these diseases and show the features observed in human disease.

Using the mice, it is possible to model both the pathogenic mechanism and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel transgenic animals useful as animal model for characterization of function of a gene encoding trinucleotide repeat proteins (TRPs), contains heterozygous disruption in a gene encoding TRP -

test substrates for the identification of drugs, pharmaceuticals, therapies and interventions which may be effective in treating trinucleotide repeat disorders e.g. fragile X synforme and Huttington's disease. The animal models for trinucleotide repeat disorders are ideal model systems to study the progression of disease in vivo, the molecular basis of these diseases and show the features observed in human disease. Using the mice, it is possible to model both the pathogenic mechanism and the trinucleotide repeat instability in the mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; open reading frame; ORFX; detection; cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; anticonvulsant; osteopathic; antiarthritic; immunosuppressant; cardiant; immunostimulant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; antitivation; antitivation; antitivation; antidiabetic; antitivation; antitivation; antitioneantic; gene therapy; cancer; proliferative disorder; hypertension; neurodegenerative disorder; osteoarthritis; graft vs host disease; cardiovascular disease; diabetes mellitus; hypothyroidism; SCID; AIDS; severe combined immunodeficiency; anticimmune disorder; asthma; allery; aplastic anaemia; nocturnal haemoglobinitia; burn; wound;

The nucleic acids can be used to express ORRY proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, praft vs host disease, cardiovascular disease, disbetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, becaterial or fungal infection, malaria, autoimmune disorders, asthma,
                                                              AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: oytostatic; hepatorropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant;

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Disclosure; SEQ ID NO 39541; 3071pp + Sequence Listing; English.

```
4-SEP-2000
             AMM64951 to AAM64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased that affect the activity of (I) by expressing in activity of (I) by expressing inactive proteins or to cylonucleotides may be used to product the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the classos and treat immune/haematopoletic-related diseases, especially cancers and cancer metastases of haematopoletic-derived cells. AAM64703 cancers and cancer metastases of haematopoletic-derived genomic sequences from the present invention. AAM54942 to AAM54950 and AAM82169 crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                             265 cccgcgggccttggtcggtttcgcaagccgctaqaggctaccggggcgagggcgggccgg 324

AMK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polymucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and matastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; SEQ ID NO 40795; 3071pp + Sequence Listing; English.

ö
that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic actived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      'Human; immune; haemaţopoietic; immune/haematopoietic antigen; cancer;

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Disclosure; SEQ ID NO 39542; 3071pp + Sequence Listing; English

AAK54951 to AAK64702 encode the human immune/haematopoletic antigen (I)
amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
cypression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
coplanded may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoletic-related diseases, especially
cancers and cancer metastases of haematopoletic-derived cells. AAK64703

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis metastasis

Disclosure; SEQ ID NO 40796; 3071pp + Sequence Listing; English.

AMK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased content affect the activity of (I) by expressing inaptient's genome that affect the activity of (I) by expressing inactive proteins or to plynucleotides may be used to production of (I). Additionally, (I) collynicationally (I) and applement the patients own production of (I). Additionally, (I) the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent. (C) protein (I) proteins and polynucleotides may be used to prevent. (I) adamone and treat immune/haematopoietic-derived cells. AAK64703 cancers and cancer metastases of haematopoietic-derived cells. AAK64703 cancers and cancer metastases of haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 ceptessent sequences used in the exemplification of the present invention.

Sequence 48045 BP; 12889 A; 9812 C; 10461 G; 14883 T; 0 other;

The human pancreatic cancer antigens have cytostatic. neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, gynaecological, cardiant and antiinflammatory activities, and can be used for greenting, treating, or amaliorating a medical condition or in assays for diagnosing a pathological condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the proteins can be used for detect, iteat or prevent pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer.
                                                                                               361
                                                                                                                                                                                                               300 GCTGCTCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCGATCCATGATCG 241
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  detection; diagnosis; identification; cytostatic; neuroprofective; nootropic; immunomodulatory; relaxant; contraceptive; gynaecological; antiinflammancry; cardiant; gene therapy; chromosome mapping; linkage analysis; tissue identification; tissue typing; forensic; neural; immune system; muscular; reproductive; gastrointestinal; pulmonary; cardiovascular; renal; proliferative; ss.

Agonists and antagonists to the antigens can be used to design nucleic pancreatic cancer antigen polynucleotides can be used to design nucleic acid hypitdisation probes that can be used in chromosome mapping, linkage analysis, tissue identification and/or typing and avariety of forensic and diagnostic methods. The proteins can be used to generate antibodies which are used to purity, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to treat or prevent neural, immune system, muscular, responductive, gastrointestinal, pulmonary, cardiovascular, renal or proliferative disorders. AAC99212 to AAC99240 and AAB54467 represent sequences used in the exemplification of the present invention.

polypeptide. Binding of the oligo to the betal-adrenoceptor mRNA, expressed from the gene encoding a mammalian betal-adrenoceptor mRNA alters transcription of the mRNA in cells. The compositions are used to treat diseases associated with increased number or activity of the cliseases associated with increased number or activity of the cliseases associated with increased number or activity of the cappositions can also be used to produce recombinant (viral) vectors for use in vaccines, for treating or preventing the diseases. The antisense oligos may also be used to detect the mRNA or related DNA, including visualization within a cell, to generate transgenic animals with altered betal-adrenoceptor activity, and to screen patients for susceptibility to hypertension, by detection of particular alleles of betal-adrenoceptor genes. The present sequence represents the polynucleotide sequence of the canine betal-adrenoceptor (GenBank Acon No: U73207).
                                                                                                                                                                                                                                                                                                                          1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          XXXX
                                                                                                                                                                 The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM36642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide system, such as peripheral nervous injuries, peripheral nervous system auch as peripheral nervous injuries, peripheral nervous localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic atteral scierosis, and Shy-Drager Syndrome. Other uses include the Activiriation of the activities such as: Immune system suppression, and thrombolytic activity, chemoclactic/chemoclinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

Zhao QA, Zhou P,
```

```
The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous to factual sed neuropaths and central nervous system diseases, such as lateral solerosis, and Shy-Drager Evoluce, Other uses include the utilisation of the activities such as: Immune system suppression, and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and includers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                      ä

The invention relates to isolated polynucleotide (I) and polynerase chain reaction (FOR) primers, oligomers, and for chromosome polymerase chain reaction (FOR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The chromosome polynucleotides are also used in diagnostics as expressed sequence tags polynucleotides are also used in fagnes therapy techniques for reactors normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical clasorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in and to produce other types of data and products dependent on DNA and among acid sequences. AAS64197-AAS94564 represent novel human can diagnostic coding sequences of the invention.

Specification, but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO at fire invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;

Submitted (20-JUL-2000) Department of Molecular Genetics, Albert Einstein College of Medicine Genome Center, 1300 Morris Park Ave. Bronx, NY 10461, USA On Apr 28, 2001 this sequence version replaced gi:11276104.
                                                                                                                                                                                                                                                                       Quality coverage: agarose-FP - N/A Quality coverage: 5.1 x in Q20 bases; sum-of-contigs estimation
                                                                                                                                                                                                                                                                                                NOTE: This is a 'working draft' sequence. It currently consists of 38 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw., SWISSPROT; Tr:, TREMBL; Wp:, WORNEP; Information on the WORNEPE database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr6 Pound at Park Cancer institute by the group of pieter de Jong. For further park Cancer institute by the group of pieter de Jong.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HS475N16
Human DNA sequence from clone RP3-475N16 on chromosome 6pl2.3-21.2.
Contains the genes for CTG4A, pre-T cell receptor alpha, a novel protein similar to RP17A (60S ribosomal protein L7A) and the 3' end gene KIAA0240. Contains ESTs, STSs, GSSs and four putative CpG islands, complete sequence.
AL035S87 5 GI:6002306
HTG: CpG island; CTG4A; KIAA0240; RPL7A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low pass sequence sampling is useful for identifying clones that may be gene-rich and allow overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   11813: contig of 662 bp in length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 52590: gap of 100 bp
53263: contig of 673 bp in length
contig of 704 bp * NOTE: This is a working draft' sequence. It currently
* consists of 37 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1422: contig of 1422 bp in length 1522: gap of unknown length 3663: gap of unknown length 4879: contig of 2041 bp in length 4879: contig of 1216 bp in length 6661: contig of 1082 bp in length 6661: contig of 1082 bp in length 7308: contig of 1197 bp in length 8607: contig of 1199 bp in length 8607: contig of 1199 bp in length 8607: contig of 2144 bp in length 10851: contig of 2144 bp in length 10851: contig of unknown length

Streptomyces coelicolor A3(2)

Bacteria: Firmicutes; Actinobacteridae;

Actinopacterias: Streptomycineae; Streptomycetaceae; Streptomyces.

(Dases 1 to 36224)

Redenbach, M., Kleser, H.M., Denapaite, D., Eichner, A., Cullum, J.,

Kinashi, H. and Hopwood, D. A.

A set of ordered cosmids and a detailed genetic and physical map

Mol. Microbiol. 21 (1), 77-96 (1996)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ABC transporter; ftsK/spolIIE family protein; hisC2; histidinol phophate aminotransferase; integrase/recombinase; histidinol phophate aminotransferase; partial thiamin blosynthesis protein thic; phea; plasmid replication initiator protein; prephenate dehydratase; secreted peptidase; serie /threonine phosphatase; sers; seryl-tRNA synthase; thiC'; two component

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       strand).

The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The length in codons is given for each CDS.

Usually the highest scoring match found by fasta -o is given for CDS which show significant similarity to other CDS in the database. The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon. Gene prediction is based on positional base preference in codons using a specially developed Hidden Markow Model (Krogh et al., Nucleic Acids Research, 22(22):4768-4778(1994)) and the FramePlot program of Bibb et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp/
jun/cgli-bin/framePlot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, ttg or (att)) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the most upstream initiation codon. If this cannot be identified we choose the most upstream initiation codon. If this cannot be identified we choose the most upstream initiation codon. If this cannot be identified we choose the most sequenced clone. It may be shorter because we only sequence sequenced clone. It may be shorter because we only sequence overlapping sections once, or longer, because we arrange for a small overlapping between neighbouring submissions. Cosmid D78 lies to the right of O11 on the Asel-D genomic restriction fragment.

NOTE: This is a 'working draft' sequence. It currently consists of 23 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

```
correction (TRR). The invention describes methods of producing embryonic stem (ES) cells comprising a heterozygous disruption in a target DNA sequence (preferably gene T243) encoding a TRP and of producing embryonic sequence (preferably gene T243) encoding a TRP and of producing a knockout mouse comprising a homozygous disruption in a gene encoding TRP, where the disruption inhibits the production of the wild type TRP. The invention also relates to identifying agents capable of affecting a phenotype of a knockout mouse. Also described are methods of determining whether expansion of the trinucleotide repeat in a gene encoding TRP produces a phenotypic change. The transgenic animals and the cells are useful for identifying compounds capable of ameliorating disease symptoms, and as test substrates for the identification of drugs, pharmaceuticals, therapies and interventions which may be effective in transiting trinucleotide repeat disorders e.g. fragile X syndrome and Huntington's disease. The animal models for trinucleotide repeat disorders e.g. traincleotide repeat closel model systems to study the progression of disease in vivo, the molecular basis of these diseases and show the features observed in human disease. Using the mice, it is possible to model both the pathogenic mechanism and the trinucleotide repeat instability in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel transgenic animals useful as animal model for characterization of function of a gene encoding trinucleotide repeat proteins (TRPs), contains heterozygous disruption in a gene encoding TRP -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present sequence for PCR primer #426 is used to amplify the T243

gene from an RI mouse embryonic stem cell genomic library. The T243 gene
encodes for a trinucleotide repeat protein (TRP). The invention describes

ceres for a trinucleotide repeat protein (TRP). The invention describes

ceres for a trinucleotide repeat protein (TRP). The invention describes

ceres encoding TRP, where the disruption inhibits the production on the

configuration in a target DNA sequence (preferably T243) encoding a TRP and

configuration in a target DNA sequence (preferably T243) encoding a TRP and

configuration of the disruption inhibits the production of the

configuration of the invention also relates to identifying agents capable

configuration whether expansion of the trinucleotide repeat in a gene

concoding TRP produces a phenotypic change. The transgenic animals and

the cells are useful for identifying compounds capable of ameliorating

disease symptoms, and as test substrates for the identification of drugs,

configuration trinucleotide repeat disorders e.g. fragile X syndrome and

treating trinucleotide repeat disorders e.g. fragile X syndrome and

the trinucleotide repeat disorders e.g. fragile X syndrome and

confiscents are ideal model systems to study the progression of disease in

convivo, the molecular basis of these diseases and show the features

convivo, the molecular basis of these diseases and show the features

convivors and the trinucleotide repeat instability in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel transgenic animals useful as animal model for characterization of function of a gene encoding trinucleotide repeat proteins (TRPs), contains heterozygous disruption in a gene encoding TRP -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence for PCR primer #488 is used to further amplify a T243 gene PCR product from pool H10 (obtained by PCR of the T243 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

from an R1 mouse embryonic stem cell genomic library). Gene T243 encodes for a trinucleotide repeat protein (TRP). The invention describes methods CC of producing embryonic stem (ES) cells comprising a heterozygous disruption in a target DNA sequence (preferably gene T243) encoding a CC in a gene encoding a knockout mouse comprising a homozygous disruption the wild type TRP. Where the disruption inhibits the production of the wild type TRP. The invention also relates to identifying agents CC appable of affecting a phenotype of a knockout mouse. The transgenic animals and the cells are useful for identifying compounds capable of aminals and the cells are useful for identifying compounds capable of aminals and the cells are useful for identifying compounds capable of identification of drugs, pharmaceuticals, therapies and interventions of identification of drugs, pharmaceuticals, therapies and interventions cranged and Huntington's disease. The animal models for trinucleotide repeat disorders are ideal model systems to study the progression of disease in vivo, the molecular basis of these diseases constant instanting the the molecular basis of these diseases of the possible to model both the pathogenic mechanism and the trinucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 49 BP; 8 A; 16 C; 13 G; 12 T; 0 other;

Novel transgenic animals useful as animal model for characterization of function of a gene encoding trinucleotide repeat proteins (TRPs), contains heterozygous disruption in a gene encoding TRP Moore M, Allen KD; WPI; 2001-300473/31.

Claim 11; Fig 14; 106pp; English.

PCR The present sequence for T243 homologous sequence #1 is generated by PCR and is homologous to the T243 gene which encodes for a trinuclectide repeat protein (TRP). The invention describes methods of producing embryonic stem (ES) cells comprising a heterozygous disruption in a target DNA sequence (preferably gene T243) encoding a TRP and of producing a knockout mouse comprising a homozygous disruption in a gene

```
encoding TRP, where the disruption inhibits the production of the wild affecting a phenotype of a knockout mouse. Also described are methods of determining whether expansion of the trinucleotide repeat in a gene encoding TRP produces a phenotypic change. The transgenic animals and the cells are useful for identifying compounds capable of ameliotating disease symptoms, and as test substrates for the identification of drugs, pharmaceuticals, therapies and interventions which may be effective in treating trinucleotide repeat disorders e.g. fragile X syndrome and the contraction of disorders are ideal model systems to study the progression of disease in ciscoders are ideal model systems to study the progression of disease in cobserved in human disease. Using the mice, it is possible to model both an example.
                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel transgenic animals useful as animal model for characterization of function of a gene encoding trinucleotide repeat proteins (TRPs), contains heterozygous disruption in a gene encoding TRP -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes for murine trinucleotide repeat protein (TRP). The invention describes methods of producing embryonic stem (ES) cells comprising a heterozygous disruption in a target DNA sequence
                                                                                                                                                                                                                                                                                                                                              Gaps

(preferably gene T243) encoding a TRP and of producing a knockout mouse comprising a homozygous disruption in a gene encoding TRP, where the disruption inhibits the production of the wild type TRP. The invention of also relates to identifying agents capable of affecting a phenotype of a knockout mouse. Also described are methods of determining whether a knockout mouse. Also described are methods of determining whether can knockout mouse. Also described are methods of determining whether capansion of the transgenic animals and the cells are useful for phenotypic change. The transgenic animals and the cells are useful for identifying compounds capable of ameliorating disease symptoms, and as test substrates for the identification of drugs, pharmaceuticals, therapies and interventions which may be effective in treating to:

Trinucleotide repeat disorders e.g. fragile X syndrome and Huntington's disease. The animal models for trinucleotide repeat disorders are ideal disease. The animal models for trinucleotide repeat disorders are ideal basis of these diseases and show the features observed in human disease. Using the mice, it is possible to model both the pathogenic mechanism and the trinucleotide repeat instability in the mouse.
                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel transgenic animals useful as animal model for characterization of function of a gene encoding trinucleotide repeat proteins (TRPs), contains heterozygous disruption in a gene encoding TRP -

The present sequence represents the DNA sequence of an expanded T243

```
gene. The T243 gene encodes. for a trinucleotide repeat protein (TRP).

The invention describes methods of producing embryonic stem (ES)

CC cells comprising a heterozygous disruption in a target DNA sequence

CC (preferably gene T243) encoding a TRP and of producing a Knockout mouse

CC comprising a homozygous disruption in a gene encoding TRP, where the

CC comprising a homozygous disruption in a gene encoding TRP, where the

CC also relates to identifying agents capable of affecting a phenotype of

a knockout mouse. Also described are methods of determining whether

C a knockout mouse. Also described are methods of determining whether

C phenotypic change. The transgenic animals and the cells are useful for

cc phenotypic change. The transgenic animals and the cells are useful for

cc phenotypic change. The identification of drugs, pharmaceuticals,

cc therapies and interventions which may be effective in treating

CC therapies and interventions which may be effective in treating

cc trinucleotide repeat disorders e.g. fragile X syndrome and Huntington's

cc disease. The animal models for trinucleotide repeat disorders are ideal

cc model systems to study the progression of disease in vivo, the molecular

model systems to study the progression of disease in vivo, the molecular

cc basis of these diseases and show the features observed in human disease.

CC the trinucleotide repeat instability in the mouse.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAS21244-AAS21518 encode for novel human secretory and transmembrane
RRO polypeptides. The PRO polypeptides are useful to detect other
RRO polypeptides, to link bloactive molecules to cells expressing
RRO polypeptides, to modulate biological activities of cells expressing
RRO polypeptides, and to detect the presence of mammalian lung, colon,
breast, prostate, rectal, cervical or liver tumours by comparing PRO
polypeptide expression in a cell sample to that in a control sample.
Some of the 275 sequences are also useful to stimulate the release of
tumour necrosis factor alpha (TNF alpha) from human blood, the
proliferation or differentiation of chondrocytes, the proliferation or
gene expression in pericyte cells, the release of proteoglycans from
cartilage, the proliferation of inner car utricular supporting cells or
of T-lymphocytes, the release of a cytchine from peripheral blood
the PRO polypeptides may modulate glucose or free fatty acid uptake by
skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide
cof factor VITA. The PRO polypeptides can be used in assays to identify
molecules involved in binding interactions. The polynucleotides encoding
PRO polypeptides can be used to generate probes, antisense RNA/DNA,
transgenic or knock out animals and can be used in gene therapy.

The present sequence is a numera and recording sequence for the human protein cbl-SL (Y94310), which is believed to play a role in the protein cbl-SL (Y94310), which is believed to play a role in the cregulation of a cell's growth, differentiation and proliferation.

Tregulation of a cell's growth, differentiation and proliferation.

Aberrant expression levels and mutant forms of tyrosine kinases which are the likely targets of cbl-SL have been found in patients with certain types of cancer. The cbl-SL have been found in patients with certain types of cancer. The cbl-SL notleotide sequence was isolated by screening a human pancreatic adenocarcinome cDNA library using the insert of I.M.A.G. E clone ID 526956 from ATCC. Individual cDNA clones were subjected to 3-4 rounds of amplification and purification and several inserts were sequenced. The sequence of the realitication and sequence comparing the cbl-SL DNA or mRNA sequence of the realiting obl-SL full-length comparing the cbl-SL DNA or mRNA sequence in the test sample to the cbl-SL DNA or mRNA sequence in the cost sample to the cbl-SL DNA or mRNA sequence in the cost sample to the cbl-SL DNA or mRNA sequence in the cost sample cot sequence cot show the cbl-SL DNA or mRNA sequence in the cost sample cot sequence cot may also be used in gene therapy and in the construction of a cbl-SL gene concent in cells and animals used to study cbl-SL activity. cbl-SL collypeptides can be used to screen peptide libraries, including partners of the colleging the colleging the colleging the colleging colleging the colleging the colleging the colleging colleging the colleging the colleging colleging the colleging the colleging the colleging colleging the colleging collegin
